Lab 5

Write an MVC application with a **layout that uses BootStrap**.
> This layout can be very simple with just a couple of headings if you like
> but there should be something both **before and after** the @RenderBody()
> line.

Add a model class that includes properties of some entity like a car, or house, etc.   Include at least three properties.

Add an Action Method similar to our DemoArray() example. You should declare and initialize an array of at least 5 items and your view should use Razor to loop through the array and display all of the property values from the entire list.
